# Chapter 9 Network Management

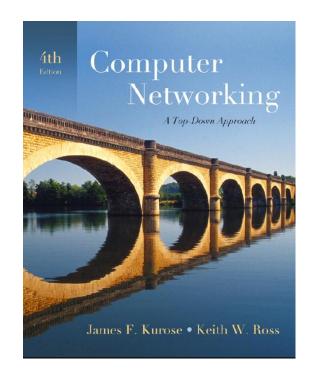

#### A note on the use of these ppt slides:

We're making these slides freely available to all (faculty, students, readers). They're in PowerPoint form so you can add, modify, and delete slides (including this one) and slide content to suit your needs. They obviously represent a *lot* of work on our part. In return for use, we only ask the following:

- If you use these slides (e.g., in a class) in substantially unaltered form, that you mention their source (after all, we'd like people to use our book!)
   If you post any slides in substantially unaltered form on a www site, that
- ☐ If you post any slides in substantially unaltered form on a www site, that you note that they are adapted from (or perhaps identical to) our slides, and note our copyright of this material.

Thanks and enjoy! JFK/KWR

#### Chapter 9: Network Management

#### Chapter goals:

- introduction to network management
  - motivation
  - o major components
- □ Internet network management framework
  - MIB: management information base
  - SMI: data definition language
  - SNMP: protocol for network management
  - security and administration
- presentation services: ASN.1

## Chapter 9 outline

- □ What is network management?
- □ Internet-standard management framework
  - Structure of Management Information: SMI
  - Management Information Base: MIB
  - SNMP Protocol Operations and Transport Mappings
  - Security and Administration
- □ ASN.1

#### What is network management?

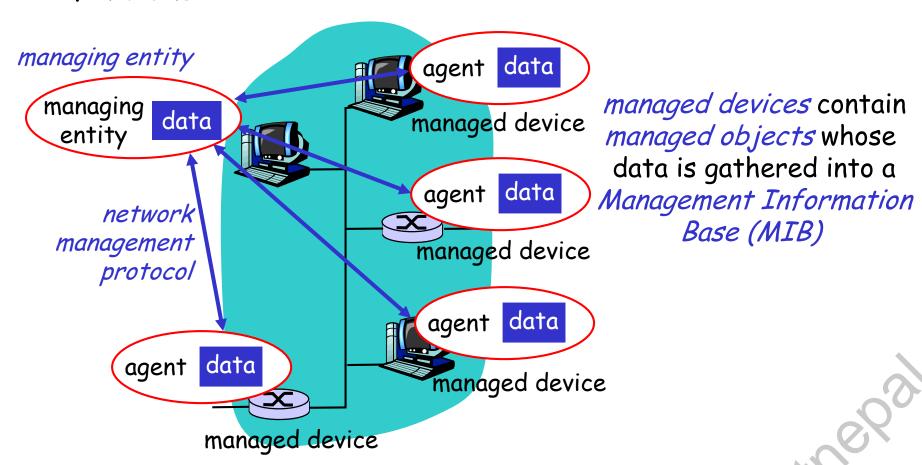

- □ autonomous systems (aka "network"): 100s or 1000s of interacting hardware/software components
- other complex systems requiring monitoring, control:
  - o jet airplane
  - o nuclear power plant
  - others?

"Network management includes the deployment, integration and coordination of the hardware, software, and human elements to monitor, test, poll, configure, analyze, evaluate, and control the network and element resources to meet the real-time, operational performance, and Quality of Service requirements at a reasonable cost."

#### Infrastructure for network management

#### definitions:

#### Network Management standards

#### OSI CMIP

- Common ManagementInformation Protocol
- designed 1980's: the unifying net management standard
- too slowly standardized

- SNMP: Simple Network Management Protocol
- □ Internet roots (SGMP)
- started simple
- deployed, adopted rapidly
- □ growth: size, complexity
- currently: SNMP V3
- de facto network management standard

## Chapter 9 outline

- What is network management?
- □ Internet-standard management framework
  - Structure of Management Information: SMI
  - Management Information Base: MIB
  - SNMP Protocol Operations and Transport Mappings
  - Security and Administration
- □ ASN.1

#### SNMP overview: 4 key parts

- Management information base (MIB):
  - distributed information store of network management data
- Structure of Management Information (SMI):
  - o data definition language for MIB objects
- ☐ SNMP protocol
  - convey manager<->managed object info, commands
- security, administration capabilities
  - major addition in SNMPv3

#### SMI: data definition language

- Purpose: syntax, semantics of management data well-defined, unambiguous
- □ base data types:
  - ostraightforward, boring
- □ OBJECT-TYPE
  - data type, status, semantics of managed object
- MODULE-IDENTITY
  - groups related objects into MIB module

#### **Basic Data Types**

INTEGER
Integer32
Unsigned32
OCTET STRING
OBJECT IDENTIFIED

**IPaddress** 

Counter32

Counter64

Guage32

Time Ticks

Opaque

## SNMP MIB

MIB module specified via SMI MODULE-IDENTITY (100 standardized MIBs, more vendor-specific) MODULE **OBJECT TYPE: OBJECT T OBJECT TYPE:** objects specified via SMI **OBJECT-TYPE** construct

#### SMI: Object, module examples

#### OBJECT-TYPE: ipInDelivers

#### MODULE-IDENTITY: ipMIB

```
ipMIB MODULE-IDENTITY
 LAST-UPDATED "941101000Z"
 ORGANZATION "IETF SNPv2
       Working Group"
 CONTACT-INFO
  " Keith McCloghrie
 DESCRIPTION
  "The MIB module for managing IP
  and ICMP implementations, but
  excluding their management of
  IP routes."
 REVISION "019331000Z"
::= \{mib-2 48\}
```

#### MIB example: UDP module

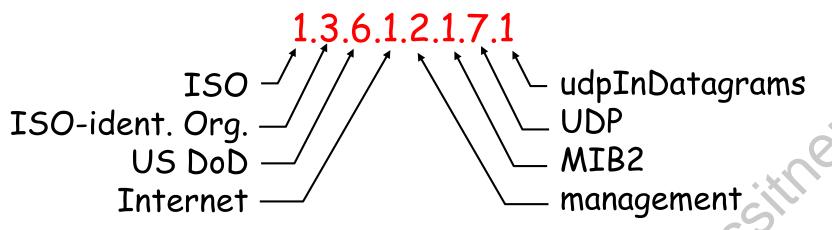

| Object ID       | Name            | Туре        | Comments                    |
|-----------------|-----------------|-------------|-----------------------------|
| 1.3.6.1.2.1.7.1 | UDPInDatagrams  | Counter32   | total # datagrams delivered |
|                 |                 |             | at this node                |
| 1.3.6.1.2.1.7.2 | UDPNoPorts      | Counter32   | # underliverable datagrams  |
|                 |                 |             | no app at portl             |
| 1.3.6.1.2.1.7.3 | UDInErrors      | Counter32   | # undeliverable datagrams   |
|                 |                 |             | all other reasons           |
| 1.3.6.1.2.1.7.4 | UDPOutDatagrams | s Counter32 | # datagrams sent            |
| 1.3.6.1.2.1.7.5 | udpTable        | SEQUENCE    | one entry for each port     |
|                 |                 |             | in use by app, gives port # |
|                 |                 |             | and IP address              |

## SNMP Naming

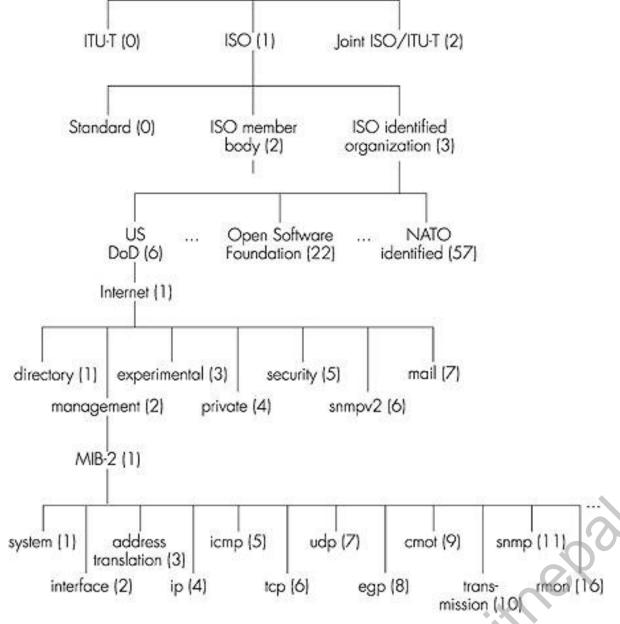

question: how to name every possible standard object
 (protocol, data, more..) in every possible network
 standard??

answer: ISO Object Identifier tree:

- hierarchical naming of all objects
- o each branchpoint has name, number

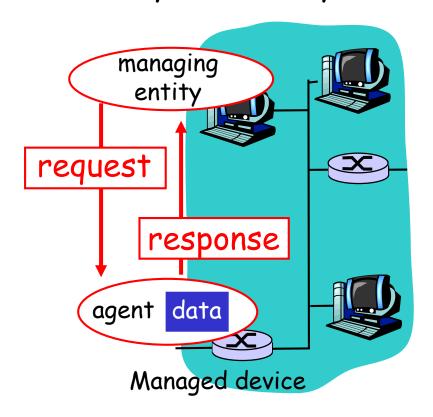

## OSI Object Identifier Tree

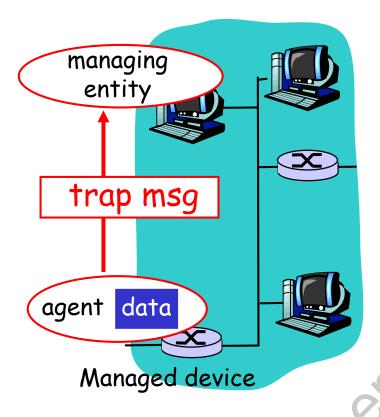

Check out www.alvestrand.no/harald/objectid/top.html

# SNMP protocol

Two ways to convey MIB info, commands:

request/response mode

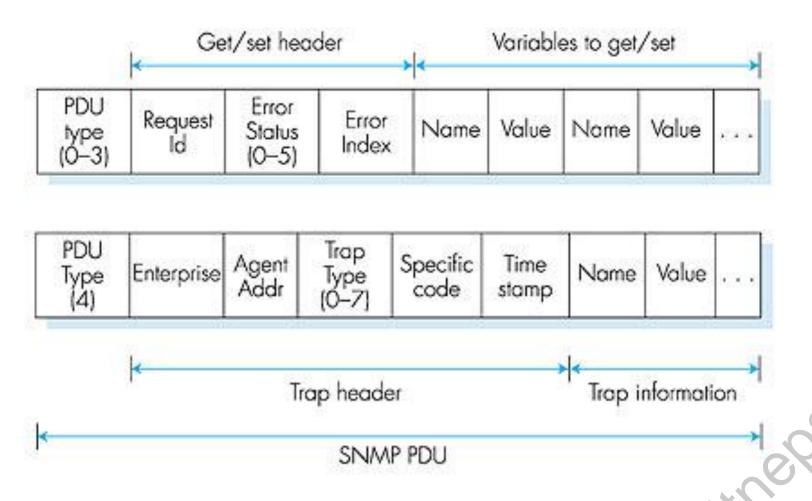

trap mode

#### SNMP protocol: message types

| Message type                                   | <u>Function</u>   |  |  |
|--|---|--|--|
| GetRequest<br>GetNextRequest<br>GetBulkRequest | Mgr-to-agent: "get me data"<br>(instance,next in list, block) |  |  |
| InformRequest                                  | Mgr-to-Mgr: here's MIB value                                  |  |  |
| SetRequest                                     | Mgr-to-agent: set MIB value                                   |  |  |
| Response                                       | Agent-to-mgr: value, response to Request                      |  |  |
| Trap   | Agent-to-mgr: inform manager of exceptional event             |  |  |

#### SNMP protocol: message formats

#### SNMP security and administration

- □ encryption: DES-encrypt SNMP message
- □ authentication: compute, send MIC(m,k): compute hash (MIC) over message (m), secret shared key (k)
- protection against playback: use nonce
- view-based access control
  - SNMP entity maintains database of access rights, policies for various users
  - o database itself accessible as managed object!

## Chapter 9 outline

- What is network management?
- □ Internet-standard management framework
  - Structure of Management Information: SMI
  - Management Information Base: MIB
  - SNMP Protocol Operations and Transport Mappings
  - Security and Administration
- The presentation problem: ASN.1

#### The presentation problem

Q: does perfect memory-to-memory copy solve "the communication problem"?

A: not always!

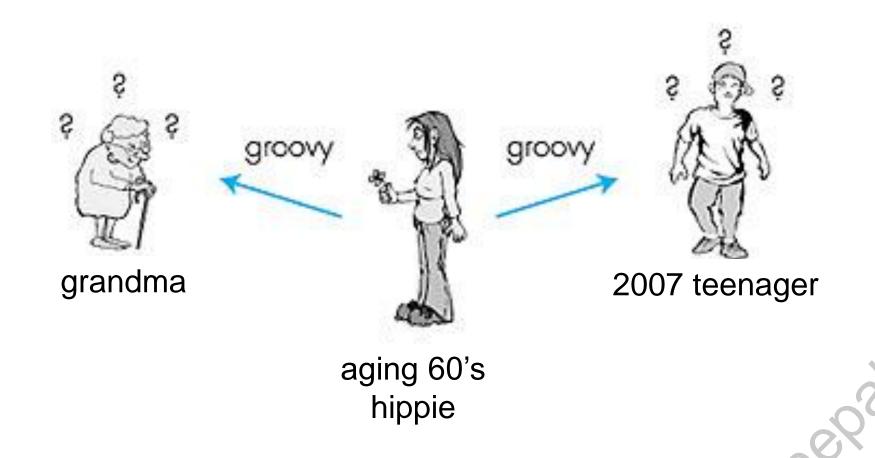

```
struct {
                test.code
                                             test.code
                                                              a
                                 a
 char code;
                            0000001
                    test.x
  int x;
                                                          0000011
                                                 test.x
                             00000011
  } test;
                                                          00000001
test.x = 256;
test.code='a'
```

problem: different data format, storage conventions

host 1 format

host 2 format

#### A real-life presentation problem:

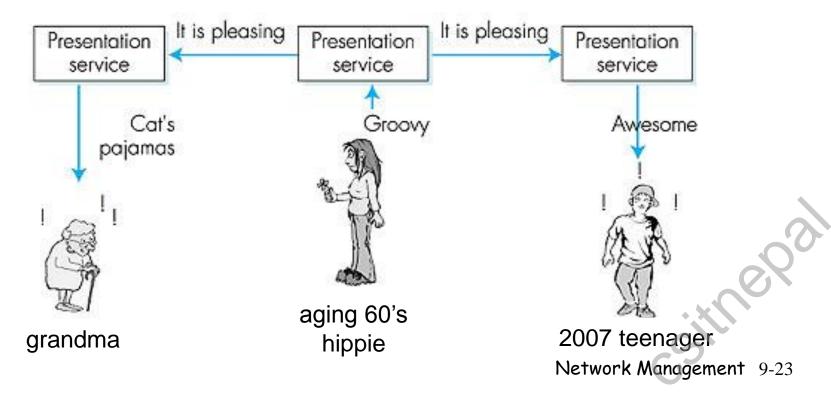

#### Presentation problem: potential solutions

- 1. Sender learns receiver's format. Sender translates into receiver's format. Sender sends.
  - real-world analogy?
  - pros and cons?
- 2. Sender sends. Receiver learns sender's format. Receiver translate into receiver-local format
  - real-world-analogy
  - pros and cons?
- 3. Sender translates host-independent format. Sends. Receiver translates to receiver-local format.
  - real-world analogy?
  - pros and cons?

#### Solving the presentation problem

- 1. Translate local-host format to host-independent format
- 2. Transmit data in host-independent format
- 3. Translate host-independent format to remote-host format

#### ASN.1: Abstract Syntax Notation 1

- □ ISO standard X.680
  - o used extensively in Internet
  - like eating vegetables, knowing this "good for you"!
- defined data types, object constructors
  - o like SMI
- □ BER: Basic Encoding Rules
  - specify how ASN.1-defined data objects to be transmitted
  - each transmitted object has Type, Length, Value (TLV) encoding

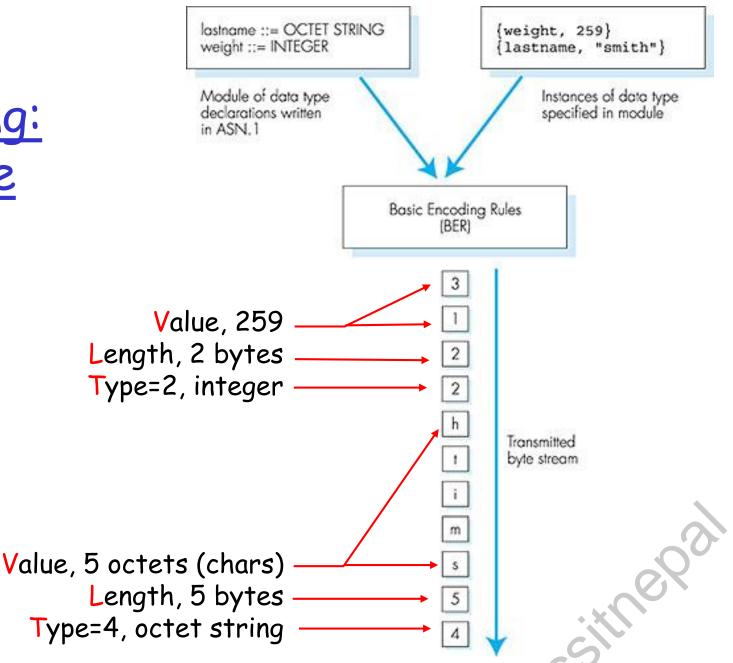

# TLV Encoding

Idea: transmitted data is self-identifying

- → T: data type, one of ASN.1-defined types
- <u>L</u>: length of data in bytes
- ∨ value of data, encoded according to ASN.1
   standard

| Tag Value | <u>Type</u>       |
|-----------|-------------------|
| 1         | Boolean           |
| 2         | Integer           |
| 3         | Bitstring         |
| 4         | Octet string      |
| 5         | Null              |
| 6         | Object Identifier |
| 9         | Real              |

# TLV encoding: example

## Network Management: summary

- network management
  - extremely important: 80% of network "cost"
  - ASN.1 for data description
  - SNMP protocol as a tool for conveying information
- □ Network management: more art than science
  - what to measure/monitor
  - how to respond to failures?
  - alarm correlation/filtering?
